

TOPICAL NEUROPATHIC PAIN CREAMS

ACTIVE INGREDIENTS

Ketoprofen 5% or 10%

A Non-Steroidal Anti-Inflammatory Drug or NSAID. This is well studied for topical use and helps relieve pain and inflammation.

Lidocaine

An anesthetic when used topically provides rapid relief from immediate pain by inducing mild numbing effects.

Gabapentin

A medication indicated for nerve pain management. When applied topically, it functions to weaken pain transmission, particularly from damaged nerves.

Cyclobenzaprine or Baclofen

A muscle relaxant when used topically blocks pain sensations between the muscle and the brain.

Ketamine 5% or 10%

An opioid medication for chronic neuropathic pain aimed at resetting pain signalling pathways. The application of low-dose opioids topically to inflamed tissues has demonstrated significant analgesic efficacy. However, it is essential to exercise caution, as higher doses may lead to side effects such as sedation and the potential for dependence.
